GEZE at Architect@Work

GEZE is presenting two innovative door solutions at ARCHITECT@WORK in Munich and in Düsseldorf. The MSW Comfort locking concept greatly simplifies the construction and disassembly of shop and system fronts. GEZE is presenting the FA GC 170 wireless extension and the TS 5000 SoftClose overhead door closer for smart, convenient retrofitting of existing doors.

“ARCHITECT@WORK” is an important industry meeting point for us to present new products and discuss with architects and planners. Through close contact even during the project planning and brainstorming phase, we can optimally combine the expertise of all actors involved – and by doing so, develop door and window solutions that are more convenient, more attractive and safer” says Gabi Bauer, Head of International Marketing at GEZE GmbH.

MSW Comfort: Locking concept for manual sliding wall systems

The MSW Comfort mechanical, automatic panel locking mechanism simplifies the construction and disassembly of shop fronts in shop fitting and of system fronts. This innovative GEZE solution makes operating manual sliding wall systems much more convenient, fast, and safe: When the glass elements are pushed, they lock together and into the floor automatically using an activator unit integrated into the lower element profile. Manual operation of the lower element profile, which would require the operator to bend down, is not needed.

System composed of FA GC 170 and TS 5000 SoftClose: Wireless extension and overhead door closer

The new GEZE wireless extension for hold-open systems and the TS 5000 SoftClose door closer create a smart system for building automation, in particular for retrofitting existing buildings. The FA GC 170 wireless extension requires no separate cables to ceiling-mounted detectors or manual trigger switches, and is also a great choice for buildings subject to historic preservation orders. The TS 5000 SoftClose overhead door closer ensures that self-

closing doors close reliably, safely, quickly and noiselessly. This solution is an especially good choice for doors used in preventative fire protection, for instance in clinics, hotels or apartment buildings, as well as in difficult installation areas, such as narrow passageways out of underground garages, stairwells or for exterior doors.
